### General Description

The SNA1G14 Single Schmitt-trigger inverter is designed for 1.65V to 5.5V  $V_{CC}$  operation.

The SNA1G14 device contains one inverter and performs the Boolean function  $Y = \overline{A}$ . The device functions as an independent inverter with Schmitt-trigger inputs, so the device has different input threshold levels for positive-going ( $V_{T+}$ ) and negative going ( $V_{T-}$ ) signals to provide hysteresis ( $\Delta V_T$ ) which makes the device tolerant to slow or noisy input signals.

This device is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.
