

SNE2413 Automotive 300-mA, High-Voltage, Ultra-Low-IQ Low-Dropout Regulator

Features

- AEC-Q100 qualified for automotive applications:
 - Temperature grade 1: $-40^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$
- Extended junction temperature range:
 - Grade 1: $-40^{\circ}\text{C} \leq T_J \leq 150^{\circ}\text{C}$
- Low quiescent current I_Q :
 - 300nA typical shutdown I_Q
 - 3.5 μA typical at light loads
- 3V to 40V wide V_{IN} input voltage range with up to 42V transient
- Maximum output current: 300 mA
- Output-voltage accuracy: 2%
- Typ. dropout voltage: 480mV@300mA load current for fixed 5V output version
- Stable with low-ESR (0.001 Ω to 1 Ω) ceramic output-stability capacitor (2.2 μF to 200 μF)
- Fixed 2.5V, 3.3V, and 5V output voltage

Typical Application

Typical Application Circuit

General Description

In automotive battery-connected applications, low quiescent current (IQ) is important to save power and extend battery lifetime. Ultra-low IQ must be included for always-on systems.

The SNE2413 is a low-dropout linear regulator designed to operate with a wide input-voltage range from 3V to 40V (45V load dump protection). Operation down to 3V allows the SNE2413 to continue operating during cold-crank and start and stop conditions. With only 3.5 μA typical quiescent current at light load, this device is an optimal solution for powering microcontrollers (MCUs) and CAN/LIN transceivers in standby systems.

The device features integrated short-circuit and overcurrent protection. Additionally, this device uses a thermally conductive package to enable sustained operation despite significant dissipation across the device. Because of these features, the device is designed as a power supply for various automotive applications.

Applications

- Automotive head units
- Telematics control units
- Headlights
- Body control modules
- Inverter and motor controls

2 Specifications

2.1 Absolute Maximum Ratings

Over operating ambient temperature range (unless otherwise noted) ^{[1][2]}.

Parameter	Symbol	Rating	Unit
VIN to GND ^[3]	V_{IN}	-0.3 ~ 42	V
EN to GND ^[3]	V_{EN}	-0.3 ~ V_{IN}	V
OUT to GND	V_{OUT}	-0.3 ~ 7	V
Junction Temperature (grade 1)	T_J	-40 ~ 150	°C
Storage Temperature Range	T_{STG}	-40 ~ 150	°C

Note:

[1] Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability;

[2] All voltage values are with respect to GND;

[3] Absolute maximum voltage, withstand 45V for 200ms.

2.2 ESD Ratings

Parameter	Symbol		Value	Unit	
Electrostatic discharge	V_{ESD}	Human-body model (HBM), per AEC Q100-002 HBM ESD classification level H2	±2000	V	
		Charged-device model (CDM), per AEC Q100-011 CDM ESD classification level C3B	Corner pins (1, 4, 5, and 8)		±750
			Other pins		±500

2.3 Recommended Operating Range

Over operating ambient temperature range (unless otherwise noted).

Parameter	Symbol	Value	Unit
Unregulated input	V_{in}	3~40	V
Enable input	V_{EN}	0~ V_{in}	V
Output capacitor requirements ^[1]	C_{OUT}	2.2~200	μF
Output capacitor ESR requirements ^[2]	ESR	0.001~1	Ω
Ambient temperature (grade 1)	T_A	-40~125	°C
Junction temperature (grade 1)	T_J	-40~150	°C

Note:

[1] The output capacitance range specified in the table is the effective value;

[2] Relevant equivalent series resistance (ESR) value at $f = 10$ kHz.

4 Detail Description

4.1 Overview

The SNE2413 is a 40V, 300mA low-dropout (LDO) linear regulator with ultra-low quiescent current. This voltage regulator consumes only 3.5 μ A of quiescent current at light load, and is designed for the automotive always-on application.

4.2 Functional Block Diagram

4.3 Feature Description

4.3.1 Device Enable (EN)

The EN pin is a high-voltage-tolerant pin. A high input activates the device and turns the regulation ON. Connect this pin to an external microcontroller or a digital circuit to enable and disable the device, or connect to the IN pin for self-bias applications.

4.3.2 Undervoltage Shutdown

This device has an integrated undervoltage lockout (UVLO) circuit to shut down the output if the input voltage (V_{IN}) falls below an internal UVLO threshold ($V_{(UVLO)}$). This threshold limit ensures that the regulator does not latch into an unknown state during low-input-voltage conditions. If the input voltage has a negative transient that drops below the UVLO threshold and recovers, the regulator shuts down and powers up with a normal power-up sequence when the input voltage is above the required level.

4.3.3 Current Limit

This device features current-limit protection to keep the device in a safe operating area when an overload or output short-to-ground condition occurs. This limit protects the device from excessive power dissipation. For example, during a short-circuit condition on the output, fault protection limits the current through the pass element to $I_{(LIM)}$ to protect the device from excessive power dissipation.

4.3.4 Thermal Shutdown

This device incorporates a thermal shutdown (TSD) circuit as a protection from overheating. For continuous normal operation, the junction temperature must not exceed the TSD trip point. The junction temperature exceeding the TSD trip point causes the output to turn off. When the junction temperature falls below the TSD trip point minus thermal shutdown hysteresis, the output turns on again.

4.4 Device Functional Modes

4.4.1 Operation With V_{IN} Lower Than 3V

The device normally operates with input voltages above 3V. The device can also operate at lower input voltages; the maximum UVLO voltage is 2.85V. At input voltages below the actual UVLO voltage, the device does not operate.

4.4.2 Operation With V_{IN} Larger Than 3V

When V_{IN} is greater than 3 V, if V_{IN} is also higher than the output set value plus the device dropout voltage, V_{OUT} is equal to the set value. Otherwise, V_{OUT} is equal to V_{IN} minus the dropout voltage.
